Hello

The Filtrr app is one of Connectis' flagship projects. To this day, we recognize it as one of our greatest successes and we want to show you what the process looked like.

Besides being appreciated by its users, our product was rewarded many industry awards, including:

Project's Goals And Objectives

Filtrr is a mobile application designed to help recruiters find the most suitable candidates, and jobseekers - a company that meets their expectations.

The most important objective of the project was to create an intuitive recruitment experience and respond to the needs of specialists as well as recruiters on the IT market.

The Team

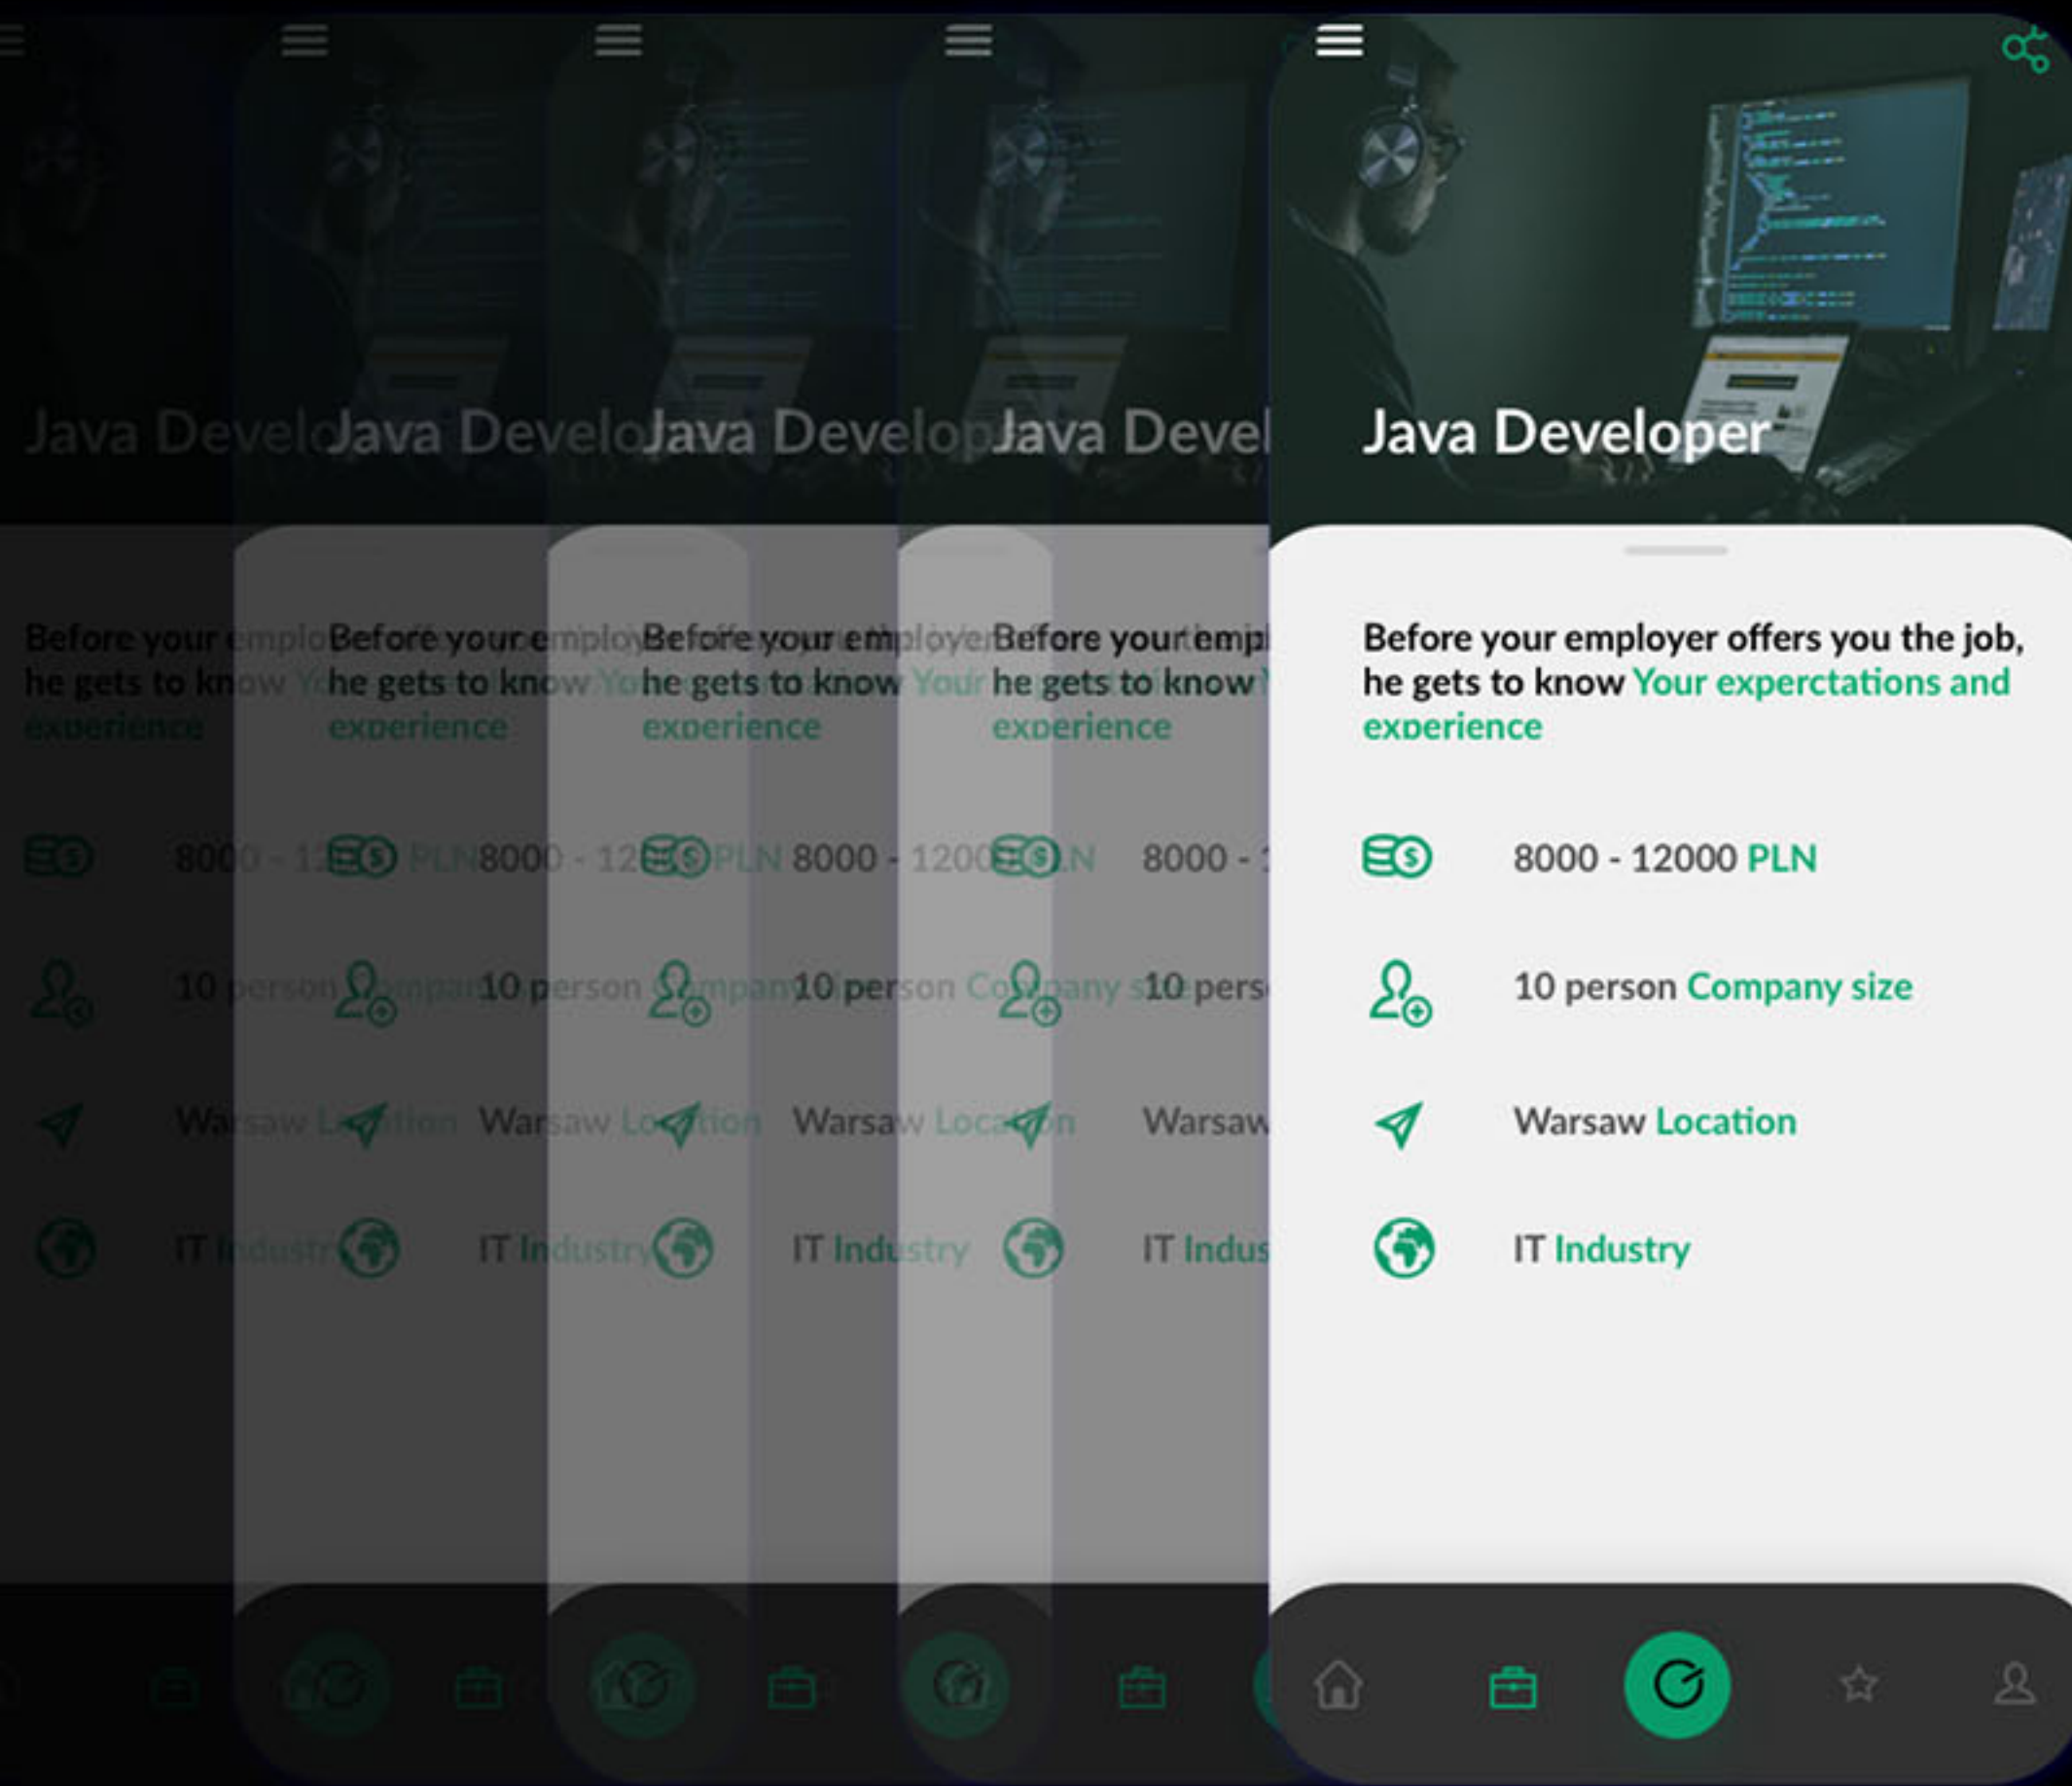

Two development teams took part in the construction of the application - the team responsible for the application for the iOS platform and the second team, responsible for the application for the Android platform.

In each of them, there were two Senior Developers and Juniors, whom we have prepared specifically for this project in C_school.

The team was built based on a thorough analysis of the competences and soft skills of the candidates in such a way that their members complemented each other. Thanks to this, we avoided unnecessary personal conflicts in the team, and the work went smoothly and efficiently.

Research And Design

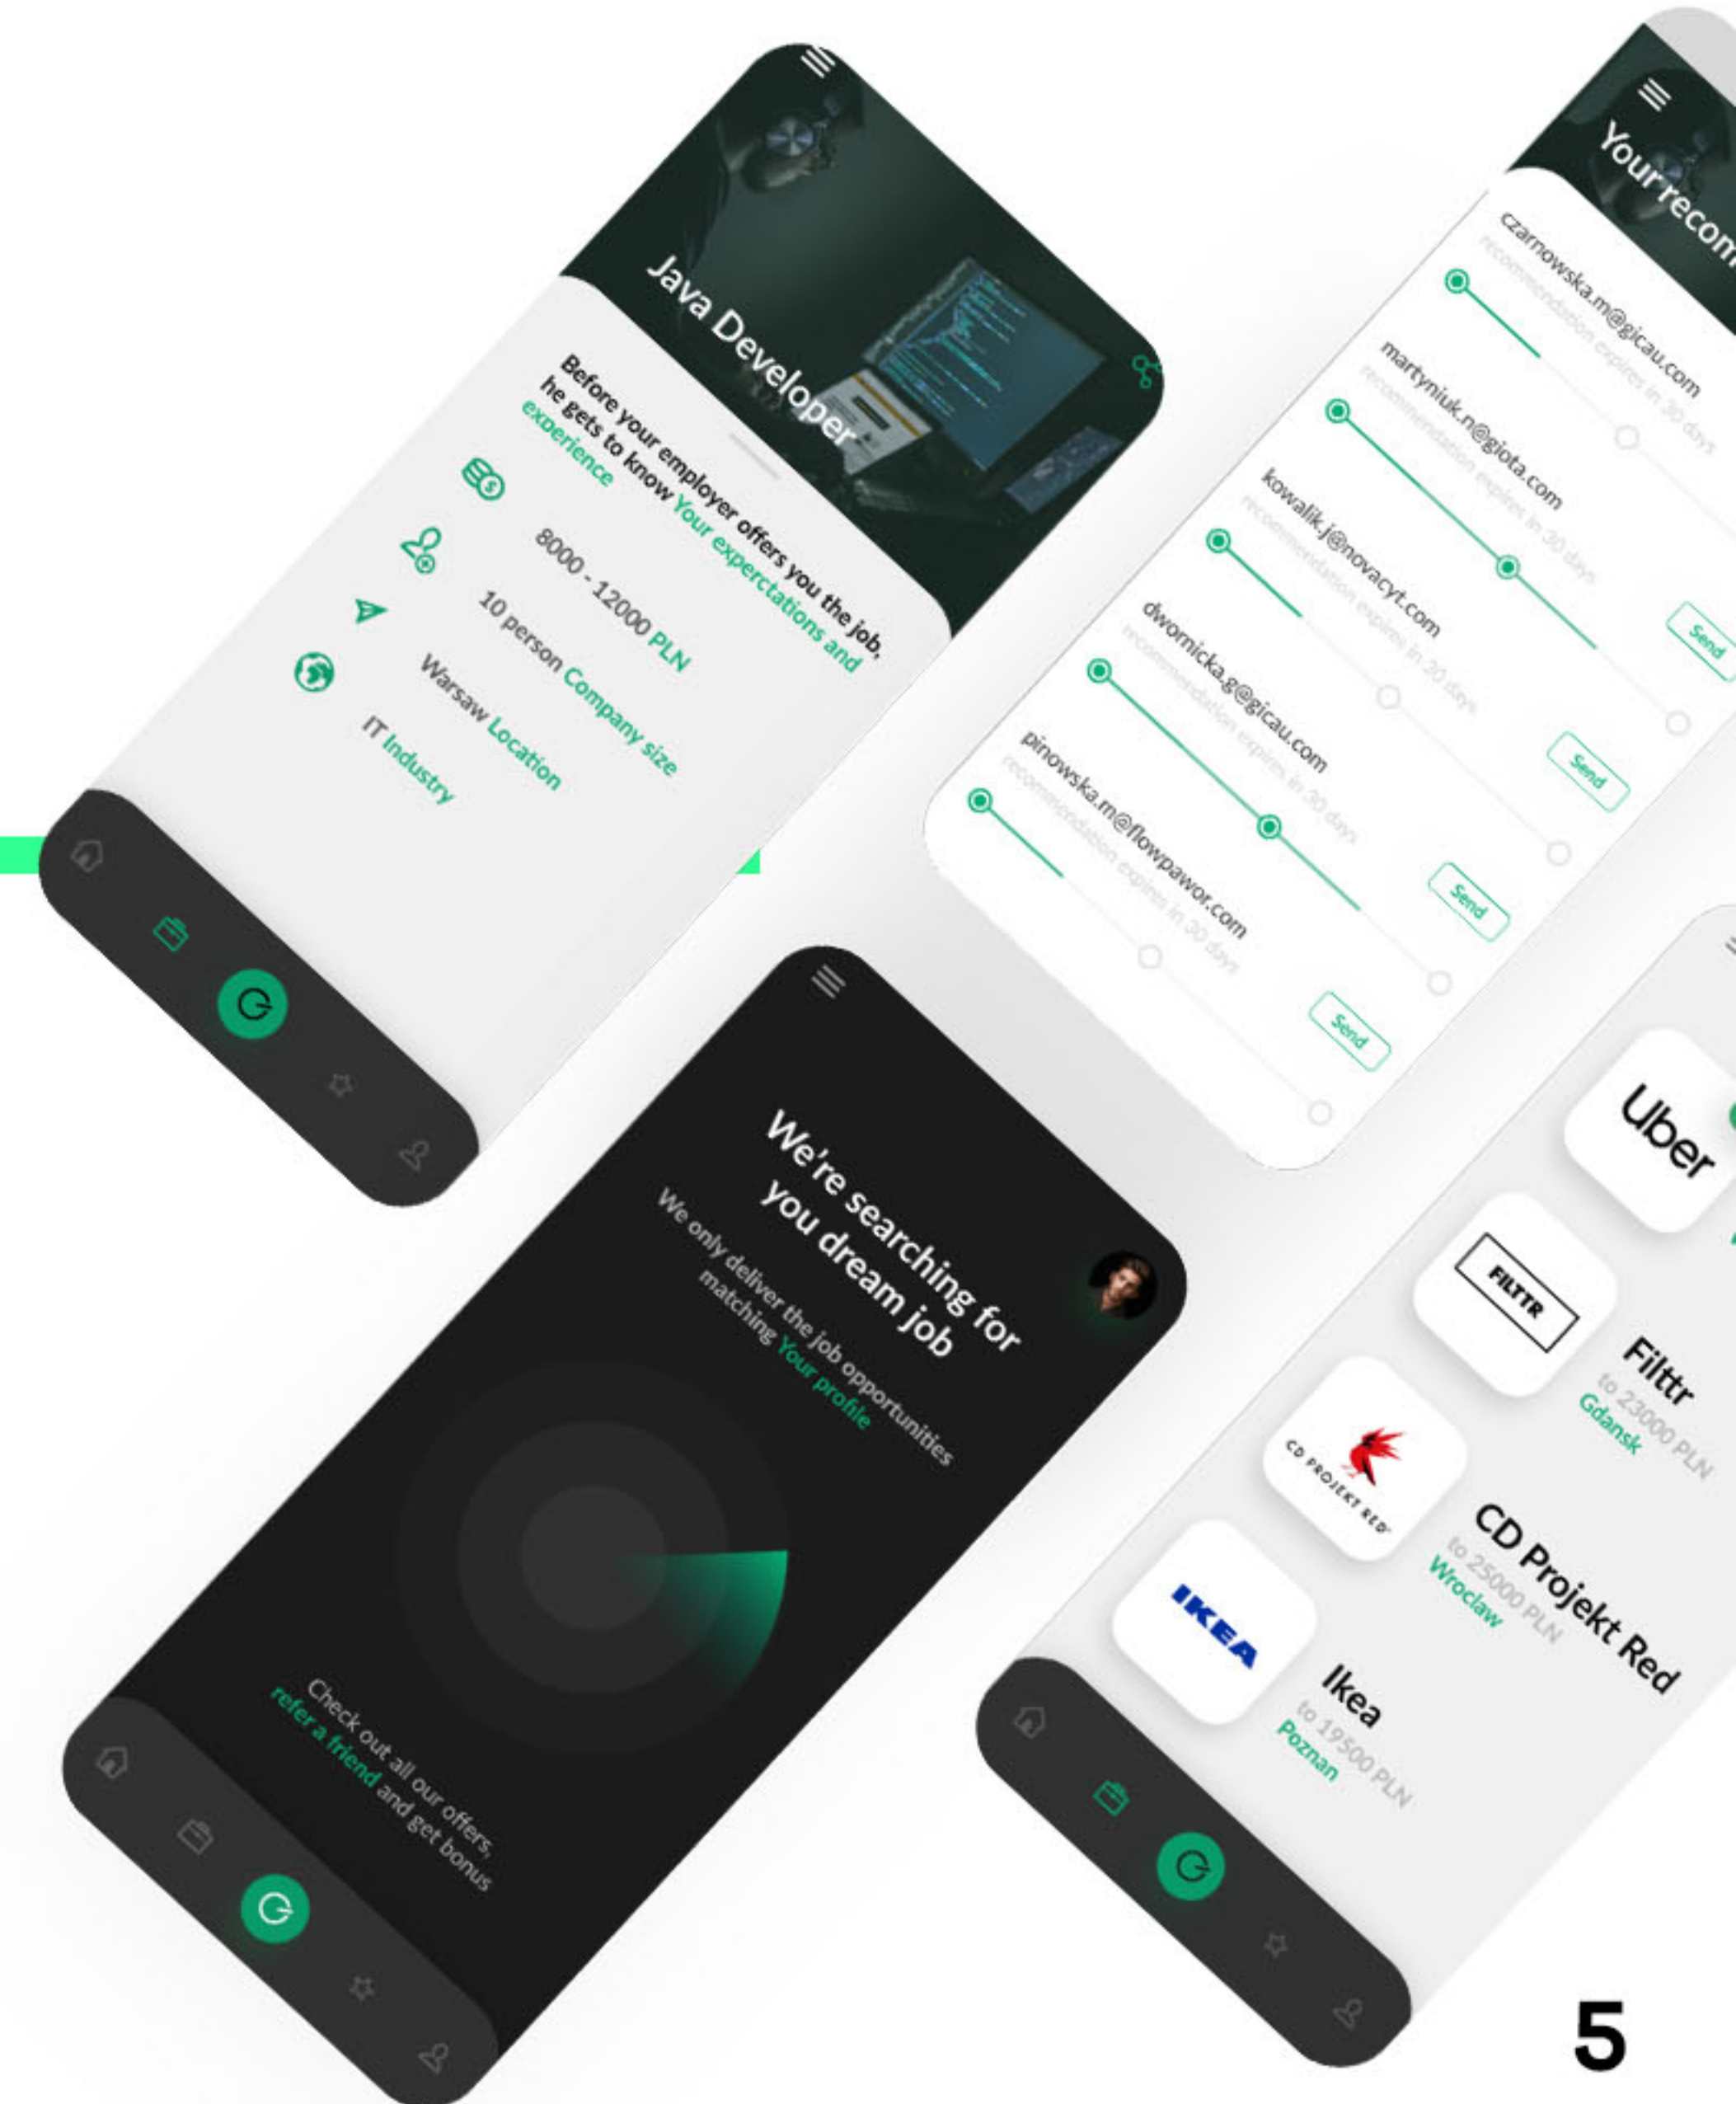

Due to the fact that Connectis operates on the IT market and is a technology company, our specialists and recruiters helped us in the research. We collected the opinions of representatives of each of these groups and created a map of functionalities according to the needs of the target users. Each of them was given priority, according to which a team of Developers worked later on.

UI / UX Designers worked in weekly iterations and conducted tests of graphic design on interactive prototypes with the participation of target recipients. The final version of the Filtr application project is the result of information and knowledge we have collected about users during these tests.

Development And Launch

Applications for iOS and Android platforms were built simultaneously. The teams complemented each other to solve current problems in each application version.

From the beginning of the development work, it took us 5 months to complete the application.

Results

The Filtr application has been implemented in line with our client's expectations and has achieved the expected success on the Polish market and beyond.

Initial time-to-market: **5 months**

Number of listings: **4 000 +**

Average user rating: **4,3/5** ★
